# SIMPLIFY THE EXECUTION PROCESS (STEP)

## Overview

The purpose of this guide is to share with you, practical steps for getting what you want; once you have identified it. This guide will therefore be most useful if you have already identified what you want.

## Introduction

The execution process is sometimes challenging; even more so when we are doing something new. We need to learn, adjust and act all at once. Not to mention that our schedule might already be packed. Sometimes we know what we want to do, and we have even started doing it. But, for some reason, we don't feel like we are getting anywhere. We then lose motivation and stop. We might start again and stop again. And the cycle might continue until we realize that it is not that we are not doing enough (*we are probably doing way too much!*), we are just not doing enough of the things that are required for goal achievement. I have an interest in helping people to get what they want because living is an active process and we feel better when we are doing what we truly want to do. My desire is that this guide helps you to take practical steps to realize your vision.

## **SIMPLIFY THE EXECUTION PROCESS (STEP)**

### ***Preliminary Step – Determine What You Want***

The first step in getting what you want is the identification of what you want. As simple as this might appear, not everyone finds this task easy. Identifying what you want is a more personal process than the execution process, and the insights that I have gained through my experience are not included in this guide. I will dive right into the execution process.

### ***STEP 1 – Preparation Phase***

Relative to what you want, you might need to do research, change location, learn new skills, make some purchases, and get mentors, among other things that might be applicable to your aspiration. You might realize that you need more things as you get further into the execution process. This is the step at which you start getting what you need - at least what you need to start. Note also, that sometimes you already have what you need. Look around you and be resourceful. Start with what you have, as long as it can get the job done. Obtain advanced tools as you grow.

### ***STEP 2 – Learning Phase***

I also call this the incubation period. In any new endeavour, you will have some learning to do. If you want to be efficient, I suggest that you dedicate time for learning before you do any major work on your project. We learn as we grow, and some activities are more hands-on than others. Be guided by what is necessary in each situation. In many cases, learning is simply part of the major execution process, and you will automatically learn as you execute. However, the dedication of a time period that is specifically ascribed to

## SIMPLIFY THE EXECUTION PROCESS (STEP)

learning will allow you the time and space to adjust to your new activity and to ensure that you are comfortable with your new process. You want to be comfortable with what you are doing. This will make the process easier to endure. I have found that there tends to be more confusion in a process when this phase is skipped.

The way in which we do things is a direct result of the way in which we learn to do things. Therefore, if we do not allow ourselves the space and time to become familiar with a new task (without a focus on the end goal), we could make unnecessary mistakes. In addition, the way that we have previously learnt to do something is not necessarily the most efficient way for us to do it. You might start a project with a firm idea about how things are done in the respective area, and what you know could add value to the process. However, it might not include the full picture, especially when you factor in your unique way of doing things. In *step 3*, I note the importance of developing your system according to what works best for you. The learning phase provides clarity on that.

Learning is a continuous process. You will learn and improve as you go. This phase allows you to master the fundamentals before you execute in any major way. And even if you end up moving on before you master the fundamentals, you will likely act with the clarity that is needed, when you first give yourself this time and space for learning. It removes potential confusion from the process as you are not just learning in terms of skill; you are also learning to pace yourself.

## SIMPLIFY THE EXECUTION PROCESS (STEP)

### **STEP 3 – System Development**

Devise a system that includes an action plan. This will break down your daily steps in the most specific manner and will specify the time frame in which you will get tasks done. Be reasonable. Based on your starting tools, figure out the easiest and most sustainable route toward goal achievement. *Note that the sustainable way is not necessarily the quickest way. Though your process can be both at the same time, easy (sustainable) does not necessarily mean fast; especially at the start.* Keep your daily steps simple. If your frequency is not daily, be guided accordingly. The important thing is that you keep it simple. Do not try to run to the finish line. Break down your activities into manageable, bite-sized pieces which you feel are easy to do. This is important, especially at the start of a project, because your mind and body need time to adjust to your new activity. The easier you keep things, the easier your adjustment phase will be. You will gain momentum with time and effort. Pace yourself and feel free to make adjustments to your system as you see fit. The key thing is that you remain in a state of balance throughout the entire execution process; as this will keep you going for the long term.

Working in defined time slots is helpful in keeping you focused and organized. However, your start time for a given activity does not have to be the same every day; unless you are performing a time-bound task. Allow yourself the space to fully integrate your lifestyle with the process, and to consider your present state of being at all times.

Make your process as simple as is practical for you. How your system looks will depend on the specifics of your tasks, the tools you use, and what works best for you. Some

## SIMPLIFY THE EXECUTION PROCESS (STEP)

systems might appear more complex and multi-layered; but your connection with them could make them simple at the core. This is a point to note. It is not about how your system looks. The benefit comes from the connection that you have with your system and how your system integrates with your lifestyle. Hence, I recommend that you take the required time to personalize your systems. Create systems that work for you and your unique life situation.

You can merge connected processes to create a more detailed system. There are many organization tools such as apps which are available to assist with the establishment and simplification of processes. Try your best to select what works best for you.

Do what is necessary to devise a system before you start a new activity in any major way. It can help with even the simplest of tasks. Devising a system can prevent a lot of hiccups in the execution process. It does so much more than gets a task done.

### ***STEP 4 – Testing Phase***

Assess where you are at in terms of skill, and test and learn how to use your tools. Make sure that you have mastered the fundamentals with respect to the required skills, tools and processes.

***For example:*** if your goal requires that you learn a new skill, ensure that you have at least learned the basic requirement for mastering this skill - what is fundamental to do or to know. Focus on this first. This minimizes the chance of you going back and forth, as when you start with the basics, you can build on that more easily than if you skip steps. Consider this as your firm foundation. Depending on your goal, this step might overlap

## **SIMPLIFY THE EXECUTION PROCESS (STEP)**

with later action as you will become more skilled and gain greater clarity on the process(es) as you move along.

### ***STEP 5 – Execution (The Fun Part!)***

Consistently execute according to the system that you devised in *Step 3*. Here, you dive into the major part of the process. Take things one step at a time, one day at a time. Do not rush the process. It is better to consistently do an excellent job than to force yourself to do a whole lot in one day, only to end up making errors in some areas. It does not matter how many things you do if all your actions are inefficient. So, take it one step at a time, and give your very best to each day's task. Your consistent effort, over time, will compound to bring you massive results.

Track your progress and be mindful. This will help you to see how you are progressing and give you an indication if there's something that you need to change.

Trust your system but don't follow it blindly. Reflect on your progress at different intervals and try to understand what your results/statistics are telling you. If you are fine with how things look, great. If you think an adjustment will improve your system, go right ahead and make it.

Give yourself reasonable time to see great results. Though your plan might sometimes need an adjustment, other times it might be working just fine, and you just need to exercise patience and be consistent.

# SIMPLIFY THE EXECUTION PROCESS (STEP)

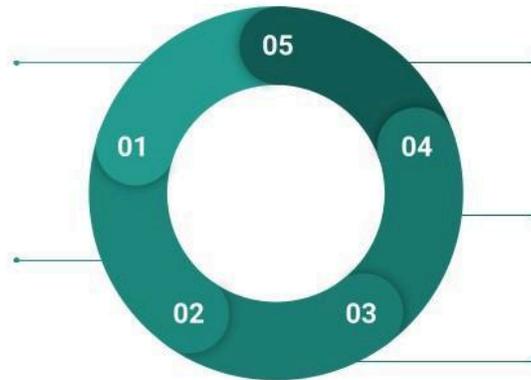

## Summary of the Execution Process

### Preparation Phase

Identify the tools, skills, guidance and other things that you will need, and start sourcing them.

### Learning Phase

This is dedicated time for learning before major execution.

### Execution

Consistently execute according to your developed system.

### Testing Phase

Assess your skill level and test your tools before you start to execute in a major way.

### System Development

Devise a system that includes an action plan.

## SIMPLIFY THE EXECUTION PROCESS (STEP)

### A Reminder

Use this reminder to keep yourself grounded throughout the process.

Sometimes we start a project with a firm idea about how it will progress. But guess what? Life happens! Or we naturally gain more clarity on the process as we go. The unexpected happens. That's life, right? Events could require minor changes or necessitate major pivoting. Remember that this is alright. Though you try your best to avoid the unexpected (*or the effects of it*), anticipate it before you even start your project.

Unexpected changes can play on the emotions. But a shift in perspective or a change to your system could lead to a significantly more effective process than it would have otherwise been. In addition, at the start of doing something new, you will likely not have the clarity that will guide you to the finish line. This is normal. You gain clarity through consistent practice, learning and application. Your result is a composite of the whole experience.

## SIMPLIFY THE EXECUTION PROCESS (STEP)

I hope that these steps help you to realize your vision.
